September 12, 2026

```
[1]: a = 40
      b = 12
      result = 0
      for _ in range(b):
          result += a
      print(result)
```

480

There are two numbers multiplied here, a is 40 and b is 12. In a “for” loop, 40 is the number we add repeatedly while b tells us how many times to add it. Simply put, we add 40, 12 times in a loop to get 480.

```
[2]: a = 40
      b = 12
      result = 0
      count = 0

      while count < b:
          result += a
          count += 1
      print(result)
```

480

Using the same values for a and b in a while loop, we are again multiplying the two numbers by adding them repeatedly. In this case, we are adding 40, 12 times. We start at 0 and the loop runs 12 times. The while count tells us that it is < 12, therefore after 12 iterations of 40, the loop stops there and we get the answer.
